

Multi-Agent Trip Planner

How to Use — step-by-step guide

Project folder: **Z:\trip-planner** | Repo: <https://github.com/rockbarla2010-gif/trip-planner>

The demo works right away — no API keys, no accounts, no cost. Follow steps 1–2 to see it run; steps 3–4 customise it; step 5 (optional) wires in real live data and AI.

1. Open the terminal in the project folder

Press the **Windows key**, type `powershell`, and press **Enter**. A dark text window opens — that is the terminal. Then type this line and press **Enter**:

```
cd Z:\trip-planner
```

2. Run it (no API keys needed)

This plans a sample trip (Tokyo) and prints the full result: flights, hotel, a day-by-day itinerary, dining, and a budget breakdown. It uses realistic placeholder data so you can see the whole multi-agent flow for free.

```
node src/cli.js --demo
```

3. Plan your own trip (change the details)

Add options to describe your trip. Mix and match any of them:

```
node src/cli.js --demo --to Paris --from London --start 2026-09-10 \
  --end 2026-09-14 --travelers 2 --budget 3000 --interests Art,Food \
  --dietary vegan --pace relaxed
```

Option	What it sets	Example
<code>--to</code>	Destination	<code>--to Paris</code>
<code>--from</code>	Origin city	<code>--from London</code>
<code>--start / --end</code>	Dates (YYYY-MM-DD)	<code>--start 2026-09-10</code>
<code>--travelers</code>	Number of people	<code>--travelers 2</code>
<code>--budget</code>	Total budget ceiling	<code>--budget 3000</code>
<code>--interests</code>	Comma-separated interests	<code>--interests Art,Food</code>
<code>--dietary</code>	Dietary needs	<code>--dietary vegan</code>
<code>--pace</code>	relaxed / moderate / packed	<code>--pace relaxed</code>

Tip: set a low `--budget` (e.g. `--budget 1500`) to watch the Budget agent flag an overage and the Orchestrator re-plan the biggest cost down. See every option any time with:

```
node src/cli.js --help
```

4. Prefer a web page instead of the terminal?

Start the built-in web server:

```
node src/server.js
```

Then open `http://localhost:3000` in your browser. Just type a **destination** and **dates** (everything else is optional) and click **Plan my trip** — the six agents fill in the rest and show flights, hotel, itinerary, dining and budget. Press **Ctrl+C** in the terminal to stop it.

Windows tip: run with node directly (as shown), not `npm run`. PowerShell may block npm's script with a "running scripts is disabled" error; `node src/server.js` and `node src/cli.js` avoid that entirely.

5. (Optional, later) Turn on real data & real AI

Everything above uses placeholder data and no AI — the fast way to see it work. To make it live, copy `.env.example` to `.env` and paste in your keys, then run **without** `--demo`:

Real flights, hotels & attractions Free Amadeus test keys — developers.amadeus.com	Real restaurants Google Places API key	Real AI orchestration ANTHROPIC_API_KEY (Claude runs the agents)
--	--	---

```
node src/cli.js --to Paris --start 2026-09-10 --end 2026-09-14 \  
  --travelers 2 --request "relaxed art and food trip"
```

Full key setup is in the repo README under "Real data — all four sources implemented".

Start with step 2 — that is the "does it work?" moment. Each run also writes a full agent trace to the `logs/` folder for debugging.
